(54) DISK-REPRODUCING DEVICE

(57)Abstract:

PROBLEM TO BE SOLVED: To provide a device which reproduces with simple operation by reading a recorded signal, reproducing an image and sound, forming the operation history data, when a required operational instruction is performed and instructing the reproducing operation answering to the operational instruction.

SOLUTION: When an angle-setting storage key of an operation part 58 is depressed, a system controller 60 forms the angle-setting data to store them in a RAM 62. When the formation and the storage of the angle-setting history data are ended, and the angle setting data don not exist, the system controller 60 decides whether or not the story selection data formed while reproducing the title contents exist. When they exist, they are collected, and the story selection history data are formed to be stored in the RAM 62. When an angle-setting storage instruction and story selection are performed during the reproducing operation, the history data are formed, each time the reproducing operation of the title contents are ended.
